Sleeping Respiratory Rate (SRR) Monitoring Table

Lilydale Vet Centre

Tracking patient.entity.name's respiratory rates while they sleep is a critical monitoring tool. This test should only be performed when your pet is sleeping in normal room temperature conditions, when they are not dreaming.

- Set a timer for 1 minute.
- Count the number of breaths, i.e. chest rising and falling = 1 breath.
- Record this number.
- If the SRR is consistently over 30 breaths per minute, contact your veterinarian.
